

NCP-AIN AI Fabric Pro Mega Lab: Spectrum-Ready Node Mapping

Recommended deployment profile

Keep **RR1**, **RR2**, **SPINE1**, **SPINE2**, **PE1**, **PE2**, and **REMOTE-DC** on Arista EOS. Swap **LEAF1-4** and **BL1-2** to your working NVIDIA Spectrum-style image. Keep **GPU-A**, **GPU-B**, **GPU-C**, **STORAGE**, and **COLLECTOR** as Ubuntu VMs.

Exact node mapping

- RR1, RR2: keep on Arista EOS, EVPN route-reflector role
- SPINE1, SPINE2: keep on Arista EOS, underlay transit and RR fanout
- LEAF1, LEAF2: swap to NVIDIA Spectrum, POD1 MLAG leaf pair
- LEAF3, LEAF4: swap to NVIDIA Spectrum, POD2 MLAG leaf pair
- BL1, BL2: swap to NVIDIA Spectrum, border MLAG pair for services and eBGP edge
- PE1, PE2, REMOTE-DC: keep on Arista EOS, external edge simulation
- GPU-A, GPU-B, GPU-C, STORAGE, COLLECTOR: keep on Ubuntu VMs

Spectrum node roles

- LEAF1: E1 to SPINE1, E2 to SPINE2, E10-11 peer-link to LEAF2, E20 GPU-A, E21 GPU-C
- LEAF2: E1 to SPINE1, E2 to SPINE2, E10-11 peer-link to LEAF1, E20 GPU-A, E21 GPU-C
- LEAF3: E1 to SPINE1, E2 to SPINE2, E10-11 peer-link to LEAF4, E20 GPU-B, E21 STORAGE
- LEAF4: E1 to SPINE1, E2 to SPINE2, E10-11 peer-link to LEAF3, E20 GPU-B, E21 STORAGE
- BL1: E1 to SPINE1, E2 to SPINE2, E10-11 peer-link to BL2, E20 COLLECTOR, E30 PE1
- BL2: E1 to SPINE1, E2 to SPINE2, E10-11 peer-link to BL1, E20 COLLECTOR, E30 PE2

EVE-NG action

Edit these six nodes in EVE-NG and replace the current **veos-lab** style image with your working NVIDIA image/template: **LEAF1**, **LEAF2**, **LEAF3**, **LEAF4**, **BL1**, **BL2**.

Leave all other network nodes unchanged unless you intentionally want an all-NVIDIA fabric variant.

Best realistic profile

Spectrum: LEAF1-4 and BL1-2. Arista: RR1, RR2, SPINE1, SPINE2, PE1, PE2, REMOTE-DC. Ubuntu: GPU-A, GPU-B, GPU-C, STORAGE, COLLECTOR.
